# Module Interface Specification for ImgBeamer

Joachim de Fourestier

April 15, 2023

# 1 Revision History

Date	Version	Notes
2023/03/18	0.1.0	Creation
	0.1.1	Update module hierarchy
2023/03/19	0.1.2	Add in module specifications
2023/03/20	0.1.3	Add in minor missing type information.
2023/03/22	0.1.4	Fix some typos, formatting, and various minor issues.
2023/03/25	0.1.5	Improve clarity and resolve minor issues.
2023/04/15	1.0.0	Changes to address feedback from Dr. Smith.

# 2 Symbols, Abbreviations and Acronyms

symbol	description
HID	Human Interface Device
URL	Uniform Resource Locator

See the SRS [2] and MG [1] Documentation for additional items.

## 3 Introduction

The following document details the Module Interface Specifications for ImgBeamer (SEM image formation demo tool). Complementary documents include the System Requirement Specifications and Module Guide. The full documentation and implementation can be found at https://github.com/joedf/CAS741\_w23.

## 4 Notation

The structure of the MIS for modules comes from Hoffman and Strooper [4], with the addition that template modules have been adapted from [3]. The mathematical notation comes from Chapter 3 of Hoffman and Strooper [4]. For instance, the symbol := is used for a multiple assignment statement and conditional rules follow the form  $(c_1 \Rightarrow r_1|c_2 \Rightarrow r_2|...|c_n \Rightarrow r_n)$ .

The following table summarizes the primitive data types used by ImgBeamer.

Data Type	Notation	Description					
integer	$\mathbb{Z}$	a number without a fractional component in $(-\infty, \infty)$					
positive integer	$\mathbb{Z}_+$	a positive integer $(\mathbb{Z})$ in $(0, \infty)$					
unsigned 8-bit integer	$\mathbb{U}$	a number without a fractional component in $(0, 255)$					
natural number	N	a number without a fractional component in $[1, \infty)$					
real	$\mathbb{R}$	any number in $(-\infty, \infty)$					
positive real	$\mathbb{R}_{+}$	any real number in $(0, \infty)$					
unit interval	$\mathbb{A}$	any real number in $(0, 1)$					
imageData [6]	$\mathbb{I}_{w,h}$	data: a one dimensional array of positive integers from 0 to 255 in RGBA order (pixel components) start from the top left pixel to the bottom right pixel with a width: $\mathbb{Z}_+$ width of $w$ and height: $\mathbb{Z}_+$ height of $h$ .					

The specification of ImgBeamer uses some derived data types: sequences, strings, tuples, booleans, and drawingObject. Sequences are lists filled with elements of the same data type. Strings are sequences of characters. Tuples contain a list of values, potentially of different types. A boolean can be represented different ways but only has two possible values: true or false. drawingObject is a geometry object (provided by Konva): the fill can be an image, a colour, or even another shape. They can have a width, height, rotation, position (x,y), and many other properties. imageDrawingObject is essentially drawingObject with an image

as the fill. drawingLayer is a layer on a drawing stage (provided by Konva). A drawing stage may have many layers. drawingStage is a sequence of drawingLayer where each can have different relative positioning and scaling. In addition, ImgBeamer uses functions, which are defined by the data types of their inputs and outputs. Local functions are described by giving their type signature followed by their specification.

# 5 Module Decomposition

The following table is taken directly from the Module Guide [1] document for this project.

Level 1	Level 2	Level 3
Hardware-Hiding Module		
	Application Control	
		Ground Truth Image Input
	Input	Imaging Parameters Input
		Spot Profile Input
	Output	Information and Metrics Display
	Output	Image Export
Behaviour-Hiding Module		Ground Truth
		Subregion
		Spot Profile
		Spot Content
	Visualization Display	Spot Signal
		Spot Layout
		Sampled Subregion
		Resulting Subregion
		Resulting Image
	Display Control	
	Graphical User Interface	
Software Decision Module		Drawing Stage / Canvas Module
	Image Manipulation	Rendering
		Metrics Calculation

Table 1: Module Hierarchy

## 6 MIS of Application Control

## 6.1 Module

main (M2)

## 6.2 Uses

GUI Module Specification (7)

## 6.3 Syntax

## 6.3.1 Exported Constants

None

## 6.3.2 Exported Access Programs

Name	In	Out	Exceptions
main	-	-	_
UpdateBa	aseImage	-	-

## 6.4 Semantics

#### 6.4.1 State Variables

None

## 6.4.2 Environment Variables

None

## 6.4.3 Assumptions

- The application is run in an HTML5 compliant web browser.
- The GUI is running and displayed without issue.

## 6.4.4 Access Routine Semantics

main():

• transition: Initializes the program and the GUI module Module (M18).

## UpdateBaseImage():

• transition: Updates the GUI and propagates a change in the input ground truth image throughout the application.

## 6.4.5 Local Functions

## 7 MIS of Graphical User Interface (GUI)

## 7.1 Module

gui (M18)

## 7.2 Uses

- Hardware Hiding Module (M1)
- Display Control Module (M17)
- Ground Truth Image Input Module (M3)
- Imaging Parameters Input Module (M4)
- Spot Profile Input Module (M5)
- Image Export Module (M6)
- Information and Metrics Display Module (M7)

## 7.3 Syntax

## 7.3.1 Exported Constants

- G\_BoxSize: A value  $(\mathbb{Z}_+)$  describing both the width and height (in pixels) used for each visualization display "box" (currently always square).
- G\_MATH\_TOFIXED: Used for display for fixed decimal number length rounding (ex. "4.1234" at fixed length "2" results in "4.12").

## 7.3.2 Exported Access Programs

Name	In	Out	Exceptions
gui	$\texttt{baseImage}\;(\mathbb{I}_{w,h})$	displayReference,	-
		event handlers	

## 7.4 Semantics

#### 7.4.1 State Variables

- baseImage: The ground truth image as processed and given by M3 as  $\mathbb{I}_{w,h}$ .
- resultImage: A reference to resulting image as processed and given by the Display Control M17 as  $\mathbb{I}_{w,h}$ .

- imageRows: Rasterization grid rows given by M4 as  $\mathbb{Z}_+$ .
- imageCols: Rasterization grid columns given by M4 as  $\mathbb{Z}_+$ .
- imageMag: Magnification of the subregion as given by M4 as  $\mathbb{R}_+$ .
- spotWidth: The spot's width given by M5 as  $\mathbb{Z}_+$ .
- spotHeight: The spot's height given by M5 as  $\mathbb{Z}_+$ .
- spotAngle: The spot's angle given by M5 as  $\mathbb{R}$ .
- dispControl: a reference to the Display Control (M17).

#### 7.4.2 Environment Variables

- Keyboard ( $\mathbb{Z}_+$  for key codes describing the key pressed)
- Mouse (Boolean for click state and  $\mathbb{Z}_+$  for cursor position)
- Screen ( $\mathbb{Z}_+$  for the width and height in pixels)
- Button (String for a file location) to input an image for ground truth (M3) from the File System.
- Number entry control  $(\mathbb{Z}_+)$  to input imaging parameters (M4)
- Shape node edit control to obtains  $(\mathbb{Z}_+)$  number describing the spot shape (M5): width, height, and rotation.

## 7.4.3 Assumptions

- The file system is able to read and provide the image file as specified by the user through an OS file-open dialog. Otherwise, if the file is not found, denied access, or cancelled, no changes should occur.
- The OS and WebBrowser are able to provide basic text or number input user controls with some basic built-in validation, and is able to handle events from Human Interface Devices (HIDs such as a mouse, keyboard, or touchscreen).

#### 7.4.4 Access Routine Semantics

OnImageLoaded():

• transition: Sets up user control event handlers (e.g., mouse clicks or drag, button presses, text input change, ...) as needed for the user input modules (M3, M4 and M5) as stated in the environment variables, initializes the Display Control Module (M17) with the individual GUI draw controls/locations for each visualization and obtains an update function reference for redraws or state changes. If another image is loaded (i.e. the image is changed), the Display Control is reinitialized with the new image.

#### • output:

- doUpdate(): notifies the Display Control Module (M17) to update / redraw the visualization displays, essentially by calling updateAll() from the Display control.
- updateInfoDisplay(): notifies the Information Display Module (M7) to update when needed (such as an input value change from the mentioned input modules).
- doExport(): Event handler for the "Export" button press, it calls the Image Export Module (M6).

#### 7.4.5 Local Functions

None

#### 7.4.6 Considerations

The input modules (M3, M4, and M5) are specified as environment variables because they are essentially just buttons or text boxes with event handlers. They can be implemented however a developer wishes as long the SRS value constrains are followed...

## 8 MIS of Information and Metrics Display

## 8.1 Module

infoDisp (M7)

## 8.2 Uses

Metrics Calculation Module (M21)

## 8.3 Syntax

## 8.3.1 Exported Constants

None

## 8.3.2 Exported Access Programs

Name	In	Out	Exceptions
${\tt updateInfo}$	$ ext{textDisplayControl} \ ( ext{string}), \  ext{baseImage} \ (\mathbb{I}_{w,h}),$	-	-
	$\texttt{resultImage} \; (\mathbb{I}_{w,h}), \\ \texttt{imageMag} \; (\mathbb{R}_+)$		

## 8.4 Semantics

## 8.4.1 State Variables

None

## 8.4.2 Environment Variables

• textDisplayControl (string): a GUI control to display text (string).

## 8.4.3 Assumptions

• A suitable display control (capable of displaying text and numbers) is constructed and displayed in the GUI for use by this module.

## 8.4.4 Access Routine Semantics

updateInfo(textDisplayControl, baseImage, resultImage, imageMag):

• transition: Calls the Metrics Calculation Module (M21) to compare the given images (baseImage and resultImage) to get metric value (R). The magnification (imageMag) and metric values are then rounded to G\_MATH\_TO\_FIXED and pushed as formatted descriptive text to textDisplayControl.

## 8.4.5 Local Functions

## 9 MIS of Image Export

## 9.1 Module

imgExport (M6)

## 9.2 Uses

None

## 9.3 Syntax

## 9.3.1 Exported Constants

None

## 9.3.2 Exported Access Programs

Name	In	Out	Exceptions
export	resultImage $(\mathbb{I}_{w,h}),$ outputPath $(\text{string})$	ImageFile $(\mathbb{I}_{w,h})$	InvalidPath

## 9.4 Semantics

#### 9.4.1 State Variables

None

## 9.4.2 Environment Variables

• outputPath: the File System path or location as a string pointing to where to write the export image file.

## 9.4.3 Assumptions

The output location is valid, writable, and accessible.

#### 9.4.4 Access Routine Semantics

export(resultImage, outputPath):

- output: an image file representing resultImage at location outputPath.
- exception: InvalidPath meaning the location cannot be written to, either because the directory is nonexistent, the path contains invalid characters, or inadequate write permissions.

## 9.4.5 Local Functions

<code>GetSuggestedFileName():</code> generates a suggested filename with a timestamp that is displayed in the save-file dialog where possible.

## 10 MIS of Display Control

## 10.1 Module

dispControl (M17)

## 10.2 Uses

- 1. Rendering Module (M20)
- 2. Ground Truth Visualization Module (M8)
- 3. Subregion Visualization Module (M9)
- 4. Spot Profile Visualization Module (M10)
- 5. Spot Content Visualization Module (M11)
- 6. Spot Signal Visualization Module (M12)
- 7. Spot Layout Visualization Module (M13)
- 8. Sampled Subregion Visualization Module (M14)
- 9. Resulting Subregion Visualization Module (M15)
- 10. Resulting Image Visualization Module (M16)

## 10.3 Syntax

## 10.3.1 Exported Constants

None

## 10.3.2 Exported Access Programs

Name	In	Out	Exceptions
Init	gtImage (imageDrawingObject), drawControls: GUI controls for 2 to 10 in section 10.2	a doUpdate function for each visualization that has one	-
doUpdateAll	-	-	_

## 10.4 Semantics

#### 10.4.1 State Variables

- drawControls: References to drawing stages/canvases for all the visualization/display modules mentioned in section 10.2
- ... and each corresponding update function (doUpdate)
- gtImage: a reference to the ground truth image data (as provided by M3).
- subregionImage: a reference to imageDrawingObject (as provided by M9).

#### 10.4.2 Environment Variables

- Mouse
- Keyboard
- Screen

#### 10.4.3 Assumptions

None

#### 10.4.4 Access Routine Semantics

Init(gtImage, drawControls...):

- transition: Initializes the drawing stages/canvases in each of the draw-control locations (drawControls see 10.2) as provided by the GUI Module (M18) and passes them to each corresponding visualization module.
- output: a doUpdate function for each of the visualization modules.

## doUpdateAll():

• transition: updates all the visualization displays by calling all the corresponding doUpdate functions.

#### 10.4.5 Local Functions

# 11 MIS of Drawing Stage / Canvas

## 11.1 Module

stage (M19)

## 11.2 Uses

None

## 11.3 Syntax

## 11.3.1 Exported Constants

None

## 11.3.2 Exported Access Programs

Name	In	Out	Exceptions
init	$\begin{array}{l} \text{container, width} \\ (\mathbb{Z}_+),  \text{height}  (\mathbb{Z}_+) \end{array}$	$\begin{array}{c} {\rm drawing\ stage} \\ {\rm (drawingStage)} \end{array}$	ContainerNotFound
getLayers	-	array of the layers (sequence of drawingLayer)	-
getContext	-	drawing context [7]	-
getContainer	-	display control / container	-
toCanvas	-	canvasAPI object [7]	-
toDataURL	-	a URL to an exported image [7] (string)	-

## 11.4 Semantics

Currently, using the implementing by the Konva [5] javascript library. Largely wraps around the HTML Canvas API object with added functionality such as layering and "transformers" for node-editable shapes.

## 11.4.1 State Variables

• width/height: the width and height of the drawing stage in pixels.

• Layers: drawing layers

- Container: the display control / container where to "paint" the images as provided by the GUI Module (M18).
- Event handlers: all the Konva objects (layers, geometries, stage) may have event handlers for HID events.

#### 11.4.2 Environment Variables

- The HIDs (e.g., mouse, keyboard) for user input events
- The Screen for display output

## 11.4.3 Assumptions

Any drawing exceptions will result in throwing errors that may be caught as needed, but will simply result in blank (or black) images with no interruption in any drawings in progress or drawing loops.

#### 11.4.4 Access Routine Semantics

#### init():

- transition: Initializes a drawing stage object with the given options where container is the control or location given by the GUI Module (M18).
- output: the drawing stage object.
- exception: ContainerNotFound meaning the given control is nonexistent or could not be found.

#### getLayers():

• output: an array of all the individual drawing layers within the stage.

#### getContext():

• output: the drawing context as defined by the CanvasAPI [7].

#### getContainer():

• output: the display container as defined/given by the GUI Module (M18) when the stage is initialized.

## toCanvas():

• output: the canvasAPI element / object [7].

#### toDataURL():

• output: a URL pointing to an image exported in-memory within the WebBrowser that can "downloaded" and saved a location specified by the user.

# 12 MIS of Image Rendering

## 12.1 Module

renderUtils (M20)

## 12.2 Uses

Drawing Stage / Canvas Module (M19)

## 12.3 Syntax

## 12.3.1 Exported Constants

defaultLineColor: the default line color (RGBA) to use for drawing grids (255,255,255,204) - types:  $(\mathbb{Z}_+, \mathbb{Z}_+, \mathbb{Z}_+, \mathbb{Z}_+)$ .

## 12.3.2 Exported Access Programs

Name	In	Out	Exceptions
drawGrid	$\begin{array}{l} \texttt{gridLayer} \\ (\texttt{drawingLayer}),  \texttt{rect} \\ (\texttt{drawingObject}), \\ \texttt{rows} \; (\mathbb{Z}_+),  \texttt{cols} \; (\mathbb{Z}_+), \\ \texttt{lineColor} \end{array}$	cell size (width/height in pixels, $\mathbb{Z}_+$ )	badGridParams
repeatDrawOnGrid	layer (drawingLayer), rect (drawingObject), rows $(\mathbb{Z}_+)$ , cols $(\mathbb{Z}_+)$ , shape (drawingObject)	-	badGridParams
ComputeProbeValue_gs	$ ext{image}\;(\mathbb{I}_{w,h}),  ext{probe}$	grayscale value $(\mathbb{U})$	-
get_avg_pixel_gs	$\texttt{rawImageData}\;(\mathbb{I}_{w,h})$	grayscale value ( $\mathbb{U}$ )	-

## 12.4 Semantics

## 12.4.1 State Variables

• drawStage: the stage or canvas (drawingStage) to draw on.

## 12.4.2 Environment Variables

#### 12.4.3 Assumptions

None

#### 12.4.4 Access Routine Semantics

drawGrid(gridLayer, rect, rows, cols, lineColor = defaultLineColor):

- transition: On drawStage, draws a line (optional colour lineColor) grid with the specified number of rows and cols (columns) on the given drawing layer (gridLayer) within the given grid rectangular bounds (rect).
- output: the computed size in pixel of a cell within the grid drawn.
- exception: badGridParams meaning non-integer or non-positive values were given for rows and cols.

repeatDrawOnGrid(layer, rect, rows, cols, shape):

- transition: On drawStage, draw a given geometry (shape) or imageDrawingObject repeated over a grid pattern with the specified number of rows and cols (columns) on the given drawing layer (layer) within the given grid rectangular bounds (rect).
- exception: badGridParams meaning non-integer or non-positive values were given for rows and cols.

ComputeProbeValue\_gs(image, probe):

- Internally uses get\_avg\_pixel\_gs() to calculate the pixel value of a locally composited or "stenciled" or "clipped" image (for sampling the region defined by the shape or probe, like a cookie cutter). Pixels that have been "stenciled" out are set to blank pixels (where all RGBA components are equal to 0) and the image is cropped to small rectangular bounding box of the "stencil" shape (probe).
- output: Gives the average pixel value (grayscale intensity: U) by sampling the given image (image) object with the given shape / geometry (probe).

get\_avg\_pixel\_gs(rawImageData):

• output: Gives the average pixel value (grayscale intensity: U) from a given imageData array (rawImageData) of the RGBA pixel values ignoring any blank pixels (where all RGBA components are equal to 0).

#### 12.4.5 Local Functions

## 13 MIS of Image Metrics Calculation

## 13.1 Module

metrics (M21)

## 13.2 Uses

None

## 13.3 Syntax

## 13.3.1 Exported Constants

None

## 13.3.2 Exported Access Programs

Name	In	Out	Exceptions
compare	$\begin{array}{c} \texttt{image1} \; (\mathbb{I}_{w,h}), \; \texttt{image2} \\ (\mathbb{I}_{w,h}) \end{array}$	similarity ratio (A)	DifferentImageSizes

## 13.4 Semantics

See the SRS [2] and MG [1] for more information.

## 13.4.1 State Variables, Environment Variables, and Assumptions

None

#### 13.4.2 Access Routine Semantics

compare(image1, image2):

- Compares the two images and computes a value representing the similarity.
- output: Gives a value (A) where 1.0 means a perfect match and 0 means zero similarity.
- exception: DifferentImageSizes meaning the size of image1 and image2 do not match.

#### 13.4.3 Local Functions

## 14 MIS of Ground Truth Visualization

## 14.1 Module

drawGroundtruthImage (M8)

## 14.2 Uses

- Rendering Module (M20)
- DrawingStage Module (M19)

## 14.3 Syntax

## 14.3.1 Exported Constants

None

## 14.3.2 Exported Access Programs

Name	In	Out	Exceptions
drawGroundtruthImage	<pre>stage (drawingStage), gtImage (imageDrawingObject)</pre>	gtImageDrawing (imageDrawingObject) doUpdate	-
	${ t subregion Image}$		
	$(\verb"imageDrawingObject")$		

## 14.4 Semantics

#### 14.4.1 State Variables

These are kept for mutation, update calls, and performance reasons.

- stage: a reference to drawing stage.
- rect: a reference to a rectangle geometry (drawingObject).
- gtImage: a reference to imageDrawingObject for the ground truth image.
- subregionImage: a reference to imageDrawingObject for the subregion image.

## 14.4.2 Environment Variables and Assumptions

#### 14.4.3 Access Routine Semantics

drawGroundtruthImage(stage, gtImage, subregionImage):

- transition: Defines (in a function doUpdate) a drawing arrangement to fill the stage with the ground truth image (gtImage as provided by the Display Control M17) with a semi-transparent rectangle (rect) representing the bounds of the subregionImage (as provided by the Display Control M17).
- output: an object with an update function (doUpdate) and a reference to rect.

## 14.4.4 Local Functions

doUpdate(): (a local copy that is called once for the first draw) Update the drawing based on the state variables.

## 15 MIS of Subregion Visualization

## 15.1 Module

drawSubregionImage (M9)

## 15.2 Uses

- Rendering Module (M20)
- DrawingStage Module (M19)

## 15.3 Syntax

## 15.3.1 Exported Constants

None

## 15.3.2 Exported Access Programs

Name	In	Out	Exceptions
drawSubregionImage	<pre>stage (drawingStage), gtImage (imageDrawingObject) updateCallback</pre>	<pre>subregionImage   (imageDrawingObject) ,</pre>	-

## 15.4 Semantics

## 15.4.1 State Variables

These are kept for mutation, update calls, and performance reasons.

- stage: a reference to drawing stage.
- gtImage: a reference to imageDrawingObject for the ground truth image.
- subregionImage: a reference to imageDrawingObject for the subregion image.
- updateCallback: (optional to pass) a function to call when an update occurs (i.e. when view bounds change).
- mouse events (scroll and drag)

#### 15.4.2 Environment Variables

The HIDs.

## 15.4.3 Assumptions

None

#### 15.4.4 Access Routine Semantics

drawSubregionImage(stage, gtImage, updateCallback = null):

- transition: Draw a view displaying a copy of the ground truth image (gtImage as provided by the Display Control M17) representing the current subregion / ROI. This view can be panned and zoomed with mouse events. The updateCallback function is called when mouse events (drag or scroll) causes the of the view bounds to change.
- output: a reference to subregionImage imageDrawingObject (which can be used like rect) representing the bounds of the current view.

#### 15.4.5 Local Functions

doUpdate(): Update the drawing based on the state variables that change on mouse event such as dragging or scrolling events (pan and zoom) and calls the updateCallback.

## 16 MIS of Spot Profile Visualization

## 16.1 Module

drawSpotProfile (M10)

## 16.2 Uses

- Rendering Module (M20)
- DrawingStage Module (M19)

## 16.3 Syntax

## 16.3.1 Exported Constants

None

## 16.3.2 Exported Access Programs

Name	In	Out	Exceptions
drawSpotProfile	stage	beam	-
	$({\tt drawingStage})$	$({\tt drawingObject})$	

## 16.4 Semantics

#### 16.4.1 State Variables

These are kept for mutation, update calls, and performance reasons.

- stage: a reference to the drawing stage.
- beam: a reference to the ellipse geometry.
- Mouse events handled by Konva for shape node-editing / "transformers".

## 16.4.2 Environment Variables

The HIDs.

## 16.4.3 Assumptions

## 16.4.4 Access Routine Semantics

drawSpotProfile(stage):

- transition: On the given drawing **stage**, draws an editable ellipse shape representing the beam/spot shape.
- output: a reference to the ellipse geometry (beam).

## 16.4.5 Local Functions

## 17 MIS of Spot Content Visualization

## 17.1 Module

drawSpotContent (M11)

## 17.2 Uses

- Rendering Module (M20)
- DrawingStage Module (M19)

## 17.3 Syntax

## 17.3.1 Exported Constants

None

## 17.3.2 Exported Access Programs

Name	In	Out	Exceptions
drawSpotContent	<pre>stage (drawingStage), subregionImage (imageDrawingObject), sBeam (drawingObject), updateCallback</pre>	<pre>sImage (imageDrawingObject)</pre>	-

## 17.4 Semantics

## 17.4.1 State Variables

These are kept for mutation, update calls, and performance reasons.

- stage: a reference to the drawing stage.
- sImage: a reference to the subregion image clone (imageDrawingObject).
- sBeam: a local reference to the beam "stencil" geometry clone (not changed).
- updateCallback: (optional to pass) a function to call when an update occurs (i.e. when the sImage position or scaling changes).
- mouse events (scroll and drag)

#### 17.4.2 Environment Variables

The HIDs.

## 17.4.3 Assumptions

None

#### 17.4.4 Access Routine Semantics

drawSpotContent(stage, subregionImage, sBeam, updateCallback = null):

- transition: On a given drawing stage (stage), draws an image clone (based on subregionImage) of the subregion (sImage) that is "stenciled" or clipped by the sBeam geometry/shape. This image can be panned and zoomed by mouse events. The updateCallback function is called when mouse events (drag or scroll) causes the image (sImage) position or scaling to change.
- output: a reference to the image (sImage) being moved and scaled.

## 17.4.5 Local Functions

doUpdate(): Update the drawing based on the state variables that change on mouse event such as dragging or scrolling events (pan and zoom) and calls updateCallback.

## 18 MIS of Spot Signal Visualization

## **18.1** Module

drawSpotSignal (M12)

## 18.2 Uses

- Rendering Module (M20)
- DrawingStage Module (M19)

## 18.3 Syntax

## 18.3.1 Exported Constants

None

## 18.3.2 Exported Access Programs

Name	In	Out	Exceptions
drawSpotSignal	sourceStage (drawingStage), destStage (drawingStage), sBeam (drawingObject)	doUpdate	-

## 18.4 Semantics

#### 18.4.1 State Variables

These are kept for mutation, update calls, and performance reasons.

- sourceStage: a reference to the drawing stage from M11 given by the Display Control M17.
- destStage: a reference to the drawing stage to the spot signal representation draw on.
- sBeam: a local reference to the beam "stencil" geometry clone (not changed).
- doUpdate: a function to call when an update occurs.

## 18.4.2 Environment Variables and Assumptions

#### 18.4.3 Access Routine Semantics

drawSpotSignal(sourceStage, destStage, sBeam):

- transition: On a given drawing stage (destStage), draws the sBeam geometry/shape filled in by the computed average pixel value from the clipped / "stenciled" image content as displayed in Spot Content (M11).
- output: an update function (doUpdate) to call (by the Display Control M17) when a redraw is needed (such as a change in Spot Content (M11)).

## 18.4.4 Local Functions

doUpdate(): (a local copy that is called once for the first draw) Update the drawing based on the state variables.

## 19 MIS of Spot Layout Visualization

## 19.1 Module

drawSpotLayout (M13)

## 19.2 Uses

- Rendering Module (M20)
- DrawingStage Module (M19)

## 19.3 Syntax

## 19.3.1 Exported Constants

None

## 19.3.2 Exported Access Programs

Name	In	Out	Exceptions
drawSpotLayout	drawStage (drawingStage), subregionImage (imageDrawingObje imgParams $(\mathbb{N}_+, \mathbb{N}_+ \mathbb{N})$ , beam (drawingObject)	, ·	-

## 19.4 Semantics

## 19.4.1 State Variables

These are kept for mutation, update calls, and performance reasons.

- drawStage: a reference to the drawing stage.
- subregionImage: a reference to the subregion image (imageDrawingObject).
- beam: a reference to the beam geometry.
- imgParams: a function to call to get the rasterization grid parameters (number of rows imageRows and columns imageCols, and magnification (imageMag) provided by M4 through the Display Control M17).
- doUpdate: a function call when an update occurs.

## 19.4.2 Environment Variables and Assumptions

None

#### 19.4.3 Access Routine Semantics

drawSpotLayout(drawStage, subregionImage, imgParams, beam):

- transition: On the given stage (drawStage), draws a grid over the subregionImage with the beam geometry clone in the center of each cell in the drawn grid representing the individual location beam/spot sampling location and spot area coverage.
- output: an update function (doUpdate).

## 19.4.4 Local Functions

doUpdate(): (a local copy that is called once for the first draw) Update the drawing based on the state variables.

## 20 MIS of Sample Subregion Visualization

## 20.1 Module

drawSampledSubregion (M14)

## 20.2 Uses

- Rendering Module (M20)
- DrawingStage Module (M19)

## 20.3 Syntax

## 20.3.1 Exported Constants

None

## 20.3.2 Exported Access Programs

Name	In	Out	Exceptions
drawSampledSubregion	drawStage (drawingStage), subregionImage (imageDrawingObject imgParams $(\mathbb{N}_+, \mathbb{N}_+, \mathbb{N})$ , beam (drawingObject)	doUpdate	-

#### 20.4 Semantics

## 20.4.1 State Variables

These are kept for mutation, update calls, and performance reasons.

- drawStage: a reference to the drawing stage.
- subregionImage: a reference to the subregion image (imageDrawingObject).
- beam: a reference to the beam geometry.
- imgParams: a function to call to get the rasterization grid parameters (number of rows imageRows and columns imageCols, and magnification (imageMag) provided by M4 through the Display Control M17).
- doUpdate: a function call when an update occurs.

## 20.4.2 Environment Variables and Assumptions

None

## 20.4.3 Access Routine Semantics

drawSampledSubregion(drawStage, subregionImage, imgParams, beam):

- transition: On the given stage (drawStage), draws the subregionImage with "stenciled" or "clipped" the beam geometry clone at the center of each cell of the rasterization grid. This display represents the image content to be sampled by the beam/spot at discrete location and the area covered by the beam.
- output: the update function (doUpdate).

## 20.4.4 Local Functions

doUpdate(): (a local copy that is called once for the first draw) Update the drawing based on the state variables.

## 21 MIS of Resulting Subregion Visualization

## 21.1 Module

drawResultingSubregion (M15)

## 21.2 Uses

- Rendering Module (M20)
- DrawingStage Module (M19)

## 21.3 Syntax

## 21.3.1 Exported Constants

None

## 21.3.2 Exported Access Programs

Name	In	Out	Exceptions
drawResultingSubregion	stage (drawingStage), subregionRect (drawingObject), gtImage (imageDrawingObject) imgParams $(\mathbb{N}_+, \mathbb{N}_+, \mathbb{N})$ , beam (drawingObject)	doUpdate	-

## 21.4 Semantics

## 21.4.1 State Variables

These are kept for mutation, update calls, and performance reasons.

- stage: a reference to the drawing stage.
- subregionRect: a reference to the subregion bounds.
- gtImage: a reference to the ground truth image (imageDrawingObject).
- imgParams: a function to call to get the rasterization grid parameters (number of rows imageRows and columns imageCols, and magnification (imageMag) provided by M4 through the Display Control M17).

- beam: a reference to the beam geometry (drawingObject).
- doUpdate: a function call when an update occurs.

## 21.4.2 Environment Variables and Assumptions

None

#### 21.4.3 Access Routine Semantics

drawResultingSubregion(stage, subregionRect, gtImage, imgParams, beam):

- transition: On the given stage (stage), draws the resampled subregion (using gtImage cropped to the bounds of subregionRect) meaning each cell in the rasterization grid (as defined by imgParams) is filled with the corresponding computed average pixel value using the "stenciled" or "clipped" image content with the beam geometry at the center of each cell as represented by the Sampled Subregion display (M14).
- output: the update function (doUpdate).

#### 21.4.4 Local Functions

doUpdate(): (a local copy that is called once for the first draw) Update the drawing based on the state variables.

## 22 MIS of Result Image Visualization

## 22.1 Module

drawResultingImage (M16)

## 22.2 Uses

- Rendering Module (M20)
- DrawingStage Module (M19)

## 22.3 Syntax

## 22.3.1 Exported Constants

None

## 22.3.2 Exported Access Programs

Name	In	Out	Exceptions
drawResultingImage	stage	${\tt updateConfigValues}$	-
	$({\tt drawingStage}),$		
	beam		
	$({\tt drawingObject}),$		
	gtImage		
	<pre>(imageDrawingObject)</pre>	),	
	subregionRect		
	$({\tt drawingObject}),$		
	${ t imgParams} \; (\mathbb{N}_+,  \mathbb{N}_+, $		
	$\mathbb{N})$		

## 22.4 Semantics

## 22.4.1 State Variables

These are kept for mutation, update calls, and performance reasons.

- stage: a reference to the drawing stage.
- beam: a reference to the beam geometry (drawingObject).
- gtImage: a reference to the ground truth image (imageDrawingObject).
- subregionRect: a reference to the subregion bounds.

• imgParams: a function to call to get the rasterization grid parameters (number of rows imageRows and columns imageCols, and magnification (imageMag) provided by M4 through the Display Control M17).

#### 22.4.2 Environment Variables

None

## 22.4.3 Assumptions

The subregionRect is smaller than the full extent of the ground truth image (gtImage).

## 22.4.4 Access Routine Semantics

drawResultingImage(stage, beam, gtImage, subregionRect, imgParams):

- transition: On the given stage (stage), continuously draws (row by row for responsiveness and performance) the resampled full image (gtImage) based on the beam shape (beam: Spot Profile M5), the rasterization grid as defined by imgParams for subregionRect (similar to Resulting Subregion M15) but extended to the full extent of the ground truth image, keeping the same relative cell size (meaning more cells or rows and columns that are "smaller" in the full image).
- output: an updateConfigValues function to call (by the Display Control M17) when there is a change in the magnification (imageMag), the rasterization grid (imageRows and imageCols) or the spot profile (beam shape, M5).

#### 22.4.5 Local Functions

updateConfigValues(): Update the values based on the state variables used for drawing.
